

Project Report – Digital Literacy

Name :- Anwita Dwivedi

Registration No. :- 25BOE10036

Branch :- Bioengineering

Year :- 1st Year

Course Code :- CSE001

Date :- 28/03/2026

Introduction of the Project

The purpose of my new position as a Student Digital Ambassador is to connect students with how to successfully and responsibly use digital tools. For my capstone project in the hiring process of becoming a Student Digital Ambassador, I have created a Digital Literacy Portfolio. My Digital Literacy Portfolio will serve as a real-life resource to all my peers. Each module for my Digital Literacy Portfolio is based on a core module of digital literacy and provides both a hands-on task and a real-world scenario a student may encounter in the digital world.

My entire project is being stored in one GitHub repository. This repository demonstrates my use and understanding of technical skills such as version control, documentation, and the creation of a central repository for all my peers to access guides, examples, and best practices for digital literacy. I am also submitting a written report along with my GitHub repository. The written report will describe the process, the challenges, and the lessons learned throughout the Digital Literacy Portfolio.

Every task I completed throughout the development of my Digital Literacy Portfolio is based upon a real-world scenario that a Digital Student Ambassador would have to experience to help other students successfully navigate the digital world.

Tasks:-

- Task 1: Complete coding exercises on beginner platforms and create documentation of the completed work.
- Task 2: Create a professional profile for GitHub, LinkedIn, and Kaggle.
- Task 3: Create a Digital Literacy Awareness quiz using Google Forms.
- Task 4: Identify digital communication tools, email etiquette, cyber safety checklists, and case studies involving each of these digital tools.
- Task 5: Create a final task to document how to teach other students to use these digital tools effectively and responsibly.

Overall, this project helps us develop technical awareness, professional communication skills, and responsible digital behaviour for academic and future career growth.

Task 1 – Presentation Report

Toolkit for Digital Students

I have created the infographic titled "Toolkit for Digital Students" using Canva, which I selected based on its ease of use, availability of many free templates, and many free icons to choose from.

The infographic contains three primary sections that present the information in a standard vertical format. The first section defines digital literacy as the ability to locate, review, evaluate, and communicate with others digitally using digital tools. The second section illustrates examples of tools that can be used for collaboration (Google Workspace), organization (Notion), and design (Canva). The third section provides a checklist with examples of safe and secure Internet usage, in the form of three points: use strong passwords, enable two-factor authentication, and verify URLs before clicking on them and before entering any information in an attempt to prevent phishing.

The consistency of the navy and teal colour scheme will help you to keep the infographics easily visually scannable and presentable. Additionally, the consistency of the icons' colour scheme also contributes to the infographics being presented in a professional manner.

The biggest challenge I faced while creating the infographic was to distil complex information into limited space while maintaining clarity; visually effective infographics establish visual hierarchy through the use of headings, icons, and short text.

Task 2 – Portfolio Report

Platform Selection

I set up and maintained accounts with 3 different platforms: GitHub, LinkedIn, and Kaggle; each of them have a specific purpose in my continuing development.

Platforms and how they support Me

GitHub will act as a way for me to build a portfolio responsible for showcasing my programming projects, by providing a type of repository of my code projects and associated documentation of those projects. I created a personal repository (README Repository) that will contain a README file with my username as the name of the repository, and will contain my name, branch, year, and an example of a learning goal of mine which is, "Through completing real-world projects that solve problems on our campus, I will be able to demonstrate how I developed this skill through utilizing a collaborative software development process."

LinkedIn will serve as the hub of my professional development network. I have filled out my Education section by including my current degree program, the school's name, and my estimated graduation date, so that I can present myself credibly to potential employees and other professionals.

Kaggle will be used as my learning tool in Data Science because it is designed to provide datasets and development environments that provide opportunities to practice my analytical skills through completing hands-on projects.

Future Workplan

Over the next four years, I plan to utilize GitHub to record all of the major projects I am creating and contributing to (by creating an open-source project) to demonstrate how I built my skills through my collegiate career. LinkedIn will assistively build my professional network, connect with alumni, and provide a showcase for my internship experiences. I will use Kaggle as my data analytics arena and transition into competitively participating after I have achieved a point where I consider myself to have developed a sufficient foundation of experience to warrant that transition. The 3 platforms will allow me to develop an interactive online identity.

Task 3 – Platforms Report

For the first task, I utilized HackerRank as my primary online resource for practicing my foundational programming skills. HackerRank is a website that offers beginner-level programming challenges and skill-based programming exercises in several different programming languages, including Python, C++, and Java.

One of the beginner-level challenges on the HackerRank platform known as Solve Me First required me to use the fundamentals of basic input output and arithmetic operations to solve the challenge in Python. Completing this task has given me the opportunity to gain familiarity with the structure of coding problems and has also provided me with a solid starting point on how to write basic programs that will allow me to successfully complete simple programming challenges. Developing these skills from using HackerRank's programming challenge tools will provide me with a stronger foundation for developing the skills necessary for my academic success. By developing these skills, I will increase my straightforward logical thinking abilities, build my programming capabilities and develop a stronger understanding of algorithmic concepts.

Google Forms

To create the quiz, I used Google Forms as my online platform (it is free to use and integrated into my college's Google suite). Google Forms was an excellent choice for my quiz because it allows for the easy access of all of my batchmate's, allows for automatic collection of completed responses, and provides me the opportunity to quickly analyze the quiz results due to the instant summary chart feature.

What I Created

I developed a 5-question "Digital Literacy Awareness Quiz" designed to assess my peers' knowledge of safe and responsible use of the internet. Included in the Google Forms description of the quiz is the answer key for my peers to use in self-assessing their knowledge prior to starting the quiz.

How This Will Help My Academic Success Google Forms will be an asset in my academic pursuits; I will have the ability to create multiple digital literacy quizzes using Google Forms.

Task 4 – Email Etiquettes Report – Scenario

Scenario

A group of students was working on a presentation using a WhatsApp group. One of them texted "Does anyone actually know what they're doing? This is a mess." The message was supposed to be as a frustration about the project's disorganization, but several teammates took it as a personal attack on their work. Two members disengaged from the group, and the resulting argument delayed the project by a lot of time.

What Could Have Been Done Differently

The situation could have been avoided by following simple etiquettes.

The frustrated member should have used clear language such as "I'm feeling overwhelmed with the current workload. Can we schedule a meeting to discuss?" Secondly, moving sensitive discussions to in-person meetings would have prevented tone misinterpretation. Finally, establishing communication guidelines at the start of the project including using emojis or tone indicators would have helped clarify intent and maintain a respectful environment.

Task 5 – Cyber Crime Report

Researching UPI Fraud (UPI) mainly accused college students for not being aware of increasing levels of scam activity that are being targeted toward them. Fraudsters usually represent themselves as either representative personnel for a class activity or customer service personnel in an attempt to earn students' trust based on being in a hurry. Additionally, students seem to remain uninformed about two institutions: Cyber Crime Helpline (1930) and Cyber Crime National Portal (cyber Crime National Portal) that allow victims to file complaints of fraud in less than five minutes. The majority of students do not file complaints or report fraud because they are ashamed or embarrassed to do so and don't realize that quick action can ensure that a fraudulent transaction is frozen and recovers any money lost.

Changing habits

I will change one of my existing habits of clicking on links sent to me through WhatsApp or SMS without verifying the source first. Before now, I felt secure in knowing that if I did not give any OTP to someone that contacted me from an unknown phone number, that it would hurt my financial security. I've learned that phishing sites, or phishing emails can copy UPI apps without requiring the victim to provide an OTP. In the future, I will be verifying the identity of the person who sent the link through separate means (i.e., by using a different medium before clicking on the link) before clicking on any links, and I will enable two-factor authentication (2FA) for all financial institution apps that I use.

Conclusion

1. First impressions matter recruiters check online profiles before interviews
2. Consistency across platforms builds trust and personal brand
3. Digital footprint audits should be done regularly, not just before job applications
4. Tools like GitHub and Notion reduce confusion compared to scattered WhatsApp messages
5. Clear documentation saves time and prevents miscommunication
6. Version control is essential for group projects with multiple contributors
7. Tone is easily misinterpreted in text choose words carefully
8. Sensitive conversations belong on calls, not group chats
9. Netiquette guidelines prevent conflicts before they start
10. UPI fraud targeting students is more common than I realized
11. Reporting to 1930 within 24 hours can freeze fraudulent transactions
12. Public Wi-Fi is a major security risk for banking activities
13. A well-organized GitHub repository demonstrates professionalism
14. Documentation is as important as the work itself
15. A structured portfolio serves as both showcase and learning resource.
